

ABSTRACT

The present invention is directed to an anisotropic conductive film and
5 manufacturing methods thereof, in which an electrically insulative porous film
made of synthetic resin is used as a base film and in which conductive parts
capable of being provided with conductiveness in the film thickness direction
are formed independently at plural positions of the base film by adhering
conductive metal to resinous parts of porous structure in such a manner as
10 piercing through from a first surface to a second surface.
